

## **HYPERGRO NUTRIENT**

**Once again Nulife Technologies is at the cutting edge of Hydroponic Technology.**

**Hypergro** contains all the nutrients essential for plant growth.

**Hypergro** contains not only the highest percentage of calcium of any of the clear single part nutrients available but in addition, contains compounds not contained in any other nutrient. These compounds allow the plant to take up more nutrients than it normally would. In effect, the plant is being “Forced Fed”.

The first thing you will notice is the thickness of the stem. It will grow to 25mm in diameter in the first two weeks of growth under good conditions. The stem thickness is the result of the plant “laying down” nutrient reserves for use later on.

The beauty of this system is that as the plants roots begin to deteriorate during the bloom period, as they normally do, then it is able to call on the reserves laid down earlier in its life and not rely entirely on its root system for the nutrients the plant need.
