

INDOOR & PATIO **PLANT FOOD**

INDOOR & PATIO PLANT FOOD is the very same formulation that the top nurseries use on their greenhouse crops. By feeding your plants with **INDOOR & PATIO** you can achieve the same results as these nurseries – lush, healthy foliage growth and vibrant flower colours. **INDOOR & PATIO** is specially designed complete plant food for all plants in containers.

The problem of maintaining vigorous and healthy plant growth over a long period in worn out potting soils is common to all container – grown plants. Usually over time they lose their vigour, go yellow and just stop growing. Even feeding a propriety brand plant food seems to make little or no difference. The problem is usually twofold. First the soil has lost all its nutrients. The organisms that were in the soil to start with have consumed all their food and have stopped working. Secondly the roots have occupied a majority of the container and the mix now holds very little water. This means that unless we are aware of this, the plant may not be getting enough water.

What can we do about it ?

INDOOR & PATIO takes a unique approach. It supplies **ALL** the plants nutrient requirements, properly balanced, **including** Calcium and Magnesium – two elements often left out of standard plant foods. This is especially important in worn out potting soils. It is an accepted fact that plants will only grow as well as the **least available amount of nutrient** will allow them to. In other words, if one essential element is completely missing, the plants will stop growing. If it is in short supply they will only grow very slowly. **INDOOR & PATIO** has the full range of essential nutrients. The second part of the equation is to stimulate the dormant microbes. **INDOOR & PATIO** contains liquid organics and humates that will do this job **every time it is used**. Over time the microbial activity will rebuild the organic matter around the plants roots, which brings with it all the benefits of an organically and microbiologically active soil

DIRECTIONS FOR USE : Indoor plants 15ml per 10 litres of water. Patio and shaded plants 30ml per 10 litres of water. Full sun 45 mls per 10 litres of water. **INDOOR & PATIO** should be used weekly during summer and fortnightly during winter.
