

MEGAYIELD

ORGANIC ADDITIVE

TUMESCING AGENT

Megayield is a revolutionary product designed to increase your crop weight especially when used with U-Turn. The use of **Megayield** has resulted in increased weight and quality for many happy growers. It combines new and old technology in a new process which stimulates plant root production. When plants are in the vegetative stage, they are vigorously growing new shoots and stems and are also increasing root mass at an exceptional rate. Once plants are turned into flower this activity slows markedly as available energy is directed towards the reproductive process. Part of the normal growing activity is the death and replacement of roots and root hairs. During the vegetative phase of growth, the root replacement process is far exceeded by the growth of new roots. However, once flowering commences, the growth of new roots is sharply curtailed. Root growth is mainly limited to replacement of dead roots. Indeed, even the activity slows as the developing flowers and fruit compete for food with the roots. After a time, root death exceeds replacement. The plant is able to do this and still reproduce itself, which is its natural function in life. The Plant is happy to do this and doesn't care what the grower wants. **Megayield** overcomes this natural process and stimulates root production. This extra root production enables enhanced uptake of nutrients over and above that which would happen normally. The result is heavier yields through swelling (tumescence) of all flower parts.

Directions for Use : Use 5 ml per litre of nutrient solution at every solution change throughout the flowering stage.
