

WEIGHT PLUS

POTASSIUM

FINISHING AGENT NPK 0-8-17

WEIGHT PLUS is a highly concentrated form of Potassium and Phosphorus which, when added to the nutrient solution in the bloom phase of plants, allows for the luxury uptake of weight producing potassium. Potassium is used by the plant in a great number of its processes. It is also important that the plant will take up amounts in excess of its needs. This extra Potassium is used in the construction of the cell walls of the plant and so adds to the weight of the final product.

A plant with high levels of Potassium is better able to resist excessively hot conditions and lack of water.

WEIGHT PLUS has a neutral pH.

In line with Nulife Technologies policy of bringing extra value to its products, **WEIGHT PLUS** is of **superior Strength and Quality**.

DIRECTIONS FOR USE:

During the bloom period add 1ml per litre to the nutrient solution along with your standard nutrient to achieve your desired E.C/C.F parts per million (ppm)

TIP : Make sure that the ventilation is adequate.
